

# Soliton SecureShield™ for MSPs

*Protect Your Clients from Web-based Threats*

## Web-borne Threats – A Growing Concern

Web apps are an integral part of your clients' business operations as they can deliver substantial financial benefits and pave the way for increased productivity and collaboration. But while the benefits are clear, the web is also the number one threat to your clients' data security. A user's device can be infected by malware simply by visiting a compromised website or by clicking on a convincing phishing link.

## Deliver Secure, Convenient Access to Cloud Resources

Soliton SecureShield provides a totally new way for managed service providers to help customers realize the benefits of web-based apps while managing the risk and avoiding additional complexity and cost.

SecureShield extends the cloud workplace into any local device to provide secure, convenient access to cloud resources. Using proven virtualization and browsing technologies, SecureShield creates an isolated "virtual container" that protects end-user devices and corporate networks and from web-borne attacks. All active content is executed in the virtual container and is safely isolated from the local network.

## SecureShield: A Complete Solution

SecureShield is a complete solution for keeping endpoints free of malware while maximizing transparency for users and control for IT. SecureShield delivers:

- **Cloud Apps Management.** A single point of control allows administrators to define and provision a configuration of cloud apps to each user. With AD/LDAP integration, users need only one password and username to access all their cloud apps.
- **Encrypted Connection.** A single encrypted and authenticated browser-based connection provides safe, controlled access to the workspace that ensures compliance with industry regulations.
- **Secure, Virtual Container.** User sessions are executed in a virtual container that locks down data and completely contains desktop-based attacks. All content – including any malware – is disposed along with the container each time the user closes the browser.

## Business Benefits

Soliton offers a simple, subscription-based billing model and technology that easily aligns with a service provider's business model. Increase the agility and ability of your managed services with Soliton.

- Prevent malware infection, lost productivity and compliance violations
- Add a critical layer to any defense-in-depth strategy
- Reduce IT management costs
- Minimize helpdesk overhead
- Reduce administrative burden of policy exceptions

## Enterprise Ready

- **Leverage Existing Infrastructure.** Easy integration with existing security infrastructure simplifies deployment.
- **Easy to Implement and Scale.** Flexible deployment options allow for the gateway to be hosted in the cloud or on-prem.
- **Powerful Policy Management.** Advanced controls allow corporate browsing policies to be managed based on user groups, user location, browser location, URL category, timeframe and more.
- **Active Directory Integration.** Options include native multifactor authentication, ID federation and single sign-on as well as seamless integration with Active Directory for identity management and policy enforcement.

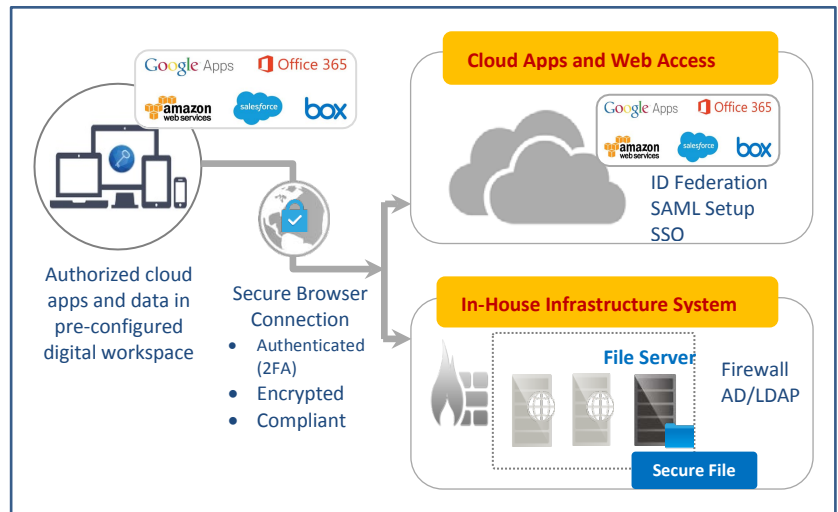

## Solution of Choice When Security Matters Most

SecureShield can be deployed to address a range of critical needs, including:

- **Failover (Backup) Connection** for network device failure, natural disaster and compliance
- **Remote Access** for sales agents, telecommuting and business travel
- **Malware Sandboxing** to disarm spam email and malicious web links
- **Kiosk or Shared PC** where simple deployment, easy maintenance and full cache wipe are crucial

## The SecureShield Advantage

- **Frictionless User Experience.** Easy-to-use and lightning fast browser let users focus on efficiency and productivity, instead of security.
- **Immunity from Malware.** Bullet-proof container defends against malware, ransomware, APTs, zero-days and drive-by downloads. Malware is unable to escape and infect the endpoint.
- **Data Loss Prevention.** Secure, virtual workspace prohibits cut, paste, copy, print and data

*Soliton SecureShield - A Totally New Way to Access Your Cloud and Web Workplace*

- **transfer to the local environment** and prohibits the sharing of data to local area apps.
- **Work With Any Device.** Browser-based container works on any device that can run a web browser (iOS, Android, Mac, Windows).
- **Unrestricted Web Access and Freedom to Browse.** Web content is executed in a secure, isolated environment, eliminating the need to “over block” web access by isolating uncategorized links or sites with potentially unsafe risk profiles. Users can safely access any web application and navigate to any website without the risk of threat to corporate data.
- **No Data Left Behind.** All temp files/registry/services are reset to default upon closing the browser, eliminating the need for frequent data cleaning or data restoration by IT admins.
- **Up-and-Running Through Internet Interruptions.** Unlike VDI, VPN, or traditional browser connections, the container works like a local environment within the secure local temp memory area. Should the internet experience an outage, users will be able to keep working.
- **Regulatory Compliance.** Encrypted tunnel delivers 100% separation between the internet and sensitive business data and enforces browsing policies.
